

The entrepreneurial spirit is alive and well, and has been thriving for nearly 30 years at CubiScan®, located in the heart of Farmington, UT. CubiScan's innovative dimensioning and weighing systems have propelled it from its inception into today's world of e-commerce and global distribution of anything and everything imaginable.

In an effort to minimize rising parcel shipping costs and increase accuracy, overall efficiency, and customer satisfaction, the CubiScan 75 was born. This new cutting-edge measuring device delivers an impressive parcel dimensioning solution for shippers to proactively take action against ongoing dim-weight shipping charges.

The new CubiScan 75 uses ground breaking 3D sensing technology to instantly measure an item, is specifically designed to be easily installed above an existing shipping station, and integrates easily with many shipping software programs such as UPS WorldShip® and Fedex Ship Manager®. It includes a unique live video display that confirms item placement and displays critical dimensional data for user verification.

The CubiScan® 75 is an advanced overhead 3D dimensioning system designed to quickly and accurately measure parcels within the common shipping line. This new cubing device will instantly measure boxes and irregular-shapes such as polybags, tubes, and many other custom packages with precision, ultimately saving shippers thousands of dollars a year on escalating shipping costs. The CubiScan 75 is an essential tool to minimize costly dimensional (dim) weight shipping charges.

CubiScan has established itself as the global choice for dimensioning and weighing systems for almost 30 years and continues to be the proven leader in parcel dimensioning.
