

ASCTrac - Integrated Solutions for Manufacturing & Distribution Operations
Shipping functions can be completely integrated with inventory attributes and customer rules to provide end-to-end perfect order execution; from the point of receipt, through manufacturing processes, automated picking, all the way through the point of delivery.

Parcel Shipping, LTL/FTL & Transportation Management Solutions

Getting customer orders out the door quickly, accurately and at the lowest cost is the life-blood of a corporation's profitability. Our solutions enforce the validation of correct items, quantities and QC rules to minimize costly returns and improve customer satisfaction.

One Stop Rate Shopping & Manifesting

We offer an integrated approach to rate shopping by providing access to the rates of hundreds of parcel and LTL/FTL carriers from a single point. Our built-in automation process handles the rate logic, totes, all carrier data with load tendering — thereby reducing manual effort and errors.

Customer Compliant Labels & Documents

An extensive set of rules for defining unique labeling and/or documentation requirements can be configured by customer, and/or at the item level. ASCTrac's embedded automation enforces these administrator defined rules to ensure compliance of customer specified rules, documents, labels, ASN and EDI transactions, certifications, export documents and more.

Automated Alerts

User definable email templates can be created to send your customers notification of shipments containing carrier tracking information, items shipped, back order information and more. Any field in the ASCTrac database can be placed in the contents of an email alert that is automatically sent when packages are manifested to keep your customers informed.

Scalable & Configurable

Our modular approach to software development allows the system to grow as your business grows and reconfigure as your needs evolve. ASCTrac is flexible and adaptable.

Multiple Deployment Options

Your business is mission critical — ASCTrac can be deployed locally or hosted, your choice.
